

GovEase: agent architecture (Future Vision hackathon, GovEase track)

One request: read documents, catch the rejection, sequence linked services, confirm, submit across departments, notify in Arabic. All in us-west-2.

* Gateway creation is denied to the workshop participant role, so the deployed runtime calls the same tool code in-process; the Lambda target and tool spec are deployed and tested.
Real: Textract, Knowledge Base, Bedrock + Guardrail, Runtime, Gateway, Memory, Translate, SNS. Mocked: departments and submissions are DynamoDB rows; documents and citizens are synthetic.
